SUMMARY

Quality Assurance Engineer with over a year of experience testing school management and digital payment products across web, mobile, and POS. Covers test case design, manual testing, API testing, and end-to-end automation in Cypress using the Page Object Model. Builds automation that stays traceable to test case documentation and leads the testing work of a larger team, most recently a 6,452-case UAT run with 30 testers.

TECHNICAL SKILLS

- **Testing:** Manual Testing, Test Planning, Test Scenario & Test Case Design, Regression Testing, Exploratory Testing, User Acceptance Testing, Bug Reporting & Validation
- **Automation:** Cypress, E2E UI Testing, API Automation, Page Object Model, Fixtures, Custom Commands
- **API Testing:** REST API Testing, Postman, Status Code & Response Structure Validation, Response Time, Negative Testing, Auth Token Flow, End-to-End CRUD
- **Performance:** k6, Load Testing, Load Scenario Design, Threshold & SLA, Throughput & Latency Analysis, Docker Compose
- **Tools:** Git, GitHub, GitHub Actions, Jira & Zephyr, Notion, Google Sheets, Mochawesome, SQL (basic)
- **Practices:** Agile/Scrum, SDLC, STLC

PROFESSIONAL EXPERIENCE

QA Engineer - PT. Cazh Teknologi Inovasi (CARDS)

July 2025 - Present | Purwokerto, Central Java, Indonesia

Sole QA engineer in a development team of five developers, two PMs, and one UI/UX designer; defining test coverage and bug reporting standards.

- Tested the CARDS ecosystem used by 700+ educational institutions: CARDS School (web dashboard), CARDS Parents, CARDS EDU, and Cazh POS with its web dashboard, across web, Android, and iOS.
- Covered the finance modules (student admissions, invoices, arrears, donations, savings, balance top-up and withdrawal), plus attendance, and selected modules of the core banking system for BKD Pekalongan.
- Designed test scenarios and test cases for new and changed features, ran regression, UI, exploratory, and responsive testing across web, mobile, and POS platforms, and prepared and executed User Acceptance Testing scenarios before release.
- Authored the UAT test case document for a major release: 6,452 cases across 20 modules.
- Ran it as a coordinated pass with 30 testers, tracking every case to completion: zero left untested, with 282 cases (4.4%) marked invalid and corrected rather than dropped.
- Wrote the test plan for a POS release: scope and out-of-scope, four risk tiers with different test depth per tier, numeric entry and exit criteria, and suspend/resume conditions.
- Designed the Cypress automation framework for the latest major releases (Page Object Model structure, test case ID naming, data-driven fixtures, and session handling), and wrote all the page objects.
- Led the QA intern team that produced ~847 test cases across 64 spec files on CARDS School V3, reviewing and correcting the specs they wrote; wrote the 86 test cases on the Cazh POS web dashboard (CPA V2) entirely myself.
- Designed the automation suite to stay traceable to the test case documentation, with every test carrying its own test case ID, using data-driven fixtures, cy.intercept for request and response verification, cy.session to avoid repeating login per test, and Mochawesome reporting configured for local runs.
- Validated incoming daily bug reports from the service team and other reporters: reproduced the findings, determined whether each was an actual defect, and explained the outcome back to the reporter.
- Performed bug hunting beyond documented test cases, both while testing specific features and during full sweeps across all products, then documented and tracked findings in Jira/Zephyr, Notion, and Google Sheets; logged and tracked 141 defects, 77 of them closed, including 3 Critical and 21 Major.
- Coordinated more than 60 QA interns: distributing test coverage, receiving their test reports, and deciding which findings were escalated to the development team.
- Reviewed interns' test cases and verified their bug reports so that anything reaching developers was valid and consistently formatted, while collaborating with Developers, PMs, and UI/UX in an Agile workflow.

PORTFOLIO PROJECTS

ParaBank Banking Automation (Cypress UI + API)

GitHub: github.com/Fajarr21/project-parabank | Live Report: fajarr21.github.io/project-parabank

- 43 test cases across 9 spec files covering UI and REST API, running automatically on GitHub Actions; the full suite completes in 3m 11s.
- Four tests left deliberately failing because they reflect real application defects (including a negative transfer amount that reverses the direction of the transfer), rather than being tuned to pass.
- Documented 8 application bugs with reproduction steps, expected vs actual, and severity.

OrangeHRM Web Automation (Cypress UI + API)

GitHub: github.com/Fajarr21/Automation-OrangeHRM | Live Report: fajarr21.github.io/Automation-OrangeHRM

- 105 end-to-end tests covering Login, Forgot Password, Directory, and API endpoints, built with the Page Object Model and data-driven fixtures, including responsive testing.
- Status code verification via cy.intercept, running automatically on GitHub Actions with passing CI and a publicly accessible Mochawesome report.

E-Commerce Web Automation (Cypress UI + API)

GitHub: github.com/Fajarr21/cypress-ui-api-automation | Live Report: fajarr21.github.io/cypress-ui-api-automation

- ~38 end-to-end tests (UI + API) built with the Page Object Model, with API testing pointed at Restful Booker as a stable target.
- Runs automatically on GitHub Actions with passing CI and a Mochawesome report.

Go vs Node.js Load Testing Benchmark (k6)

Live Dashboard: fajarr21.github.io/go-vs-node-benchmark/dashboard

- Designed a controlled benchmark comparing Go and Node.js backends: 712,788 requests across 16 runs (4 endpoints × 2 stacks × 2 load levels) on a Docker Compose stack with shared PostgreSQL and Redis so results stayed comparable.
- Set thresholds of p95 < 500 ms, error rate < 1%, and checks > 99%, then analysed the trade-off between throughput and latency.
- Identified a measurement anomaly in the load generator and withheld conclusions until the cause was clear.

EDUCATION

Bachelor of Informatics Engineering - Universitas Amikom Purwokerto | 2026 - Present

SMK Maarif NU 1 Ajibarang - Software Engineering | Graduated 2025

CERTIFICATIONS

- **Quality Assurance Bootcamp - Sanbercode (Apr-May 2026) | No. 49357/871/SNBR/BOOTCAMP/V/2026 | sanbercode.com/certificate/in/e049f3ef-b52e-4d2a-bc96-37609598df10**
- **K6 for Engineers: Load Testing Real-World Apps at Scale - BuildWithAngga (Jul 2026) | Credential ID: vd5luchyYI**
